Fadadu Kuldeep

CERTIFICATE

(Will be provided by College)

PREFACE

Project work is mainly concerned with how we get use of various facilities that are provided by Information Technology to make user's efforts easier and faster with some extra ordinary facilities.

As we know that BCA is a course on "Computer Application" and it is totally practical field. Only theoretical knowledge is not enough. In the course of BCA designed by the "Bhakta Kavi Narsinh Mehta University" they have taken full care of this thing and designed the course in such a manner with which student can get theoretical and practical both type of knowledge perfectly. According to the rules & regulation of "Bhakta Kavi Narsinh Mehta University" in the course of BCA 5th semester we have to create a Online Food Dilevery project of any organization or industry.

As a BCA students, we have visited Different Web Sites Of Food Dilevery. This project entirely focuses on making different types of Bearings.

In this way we take "Online Food Dilevery" project on our hand.Our. It is very comfortable and useful for the students.

So, We have tried as our best present this project report in such a way that it makes easy to understand the project work for the "Online Food Dilevery".

ACKNOWLEDGEMENT

The Presentation of this report gives us the feeling of fulfillment. Industrial orientation has bridged the gap between academics and practical real life work forum. It has prepared us to apply ourselves better to become a good professional. We are very thankful to all, by whose help we have prepared this project. We are very happy to represent this "Project Report". We have an opportunity to express our view.

We like to express our deepest sense of gratitude to our project guides **Prof. Sandip Upadhyay** who have always inspired us and directed us towards the successful completion of our project may be only a dream.

We are very thankful to honorable director of Shashtri Swami Shree Dharmajivandasji Institute of Information Technology Junagadh **Mr. Bharad Sir**, We specially thank.

At last but not least, How could we forget the co-operation extended by all the students of BCA(5th sem.) to whom we meet for this project advice.

Yours Faithfully,

Fadadu Kuldeep

Project Profile

Project Title	Online Food Delivery
Objective	Providing Online Food Delivery
Platform	
Front End	PHP,HTML
Back End	MYSQL
Editor	Subline
Project Team Size	1 Member
Developed By	Fadadu Kuldeep s.
Submitted To	S.S.S.D.I.I.T Collage,Junagadh.

INTRODUCTION

- This system is accessed by any user by entering URL of this website in any browser with internet.
- Any user can apply for membership feedback.
- Any user can apply for registration and login in website.
- Any user can watch videos, images in website.
- Admin can add, remove, update, see all admins.
- Admin can see all peoples who applied for membership form.
- Admin can see, add, remove, update images.
- Admin can see all registers peoples in website.
- Admin can also see feedbacks and delete too.

Software Requirements

Operating system :- Windows 7

Browser :- Chrome, Mozilla Firefox

Database :- MySQL

Language :- PHP

Software Study

HTML:

HTML Stands for "Hyper Text Markup Language". It is used to structure and format documents for presentation on the web. HTML enhances ASCII files with markup tags that permit the display of the variety of fonts, images, and highlighting options. It also designates structural elements such as headers, lists and paragraphs and provides hypertext links to other documents on the Internet.

HTML is first introduced in 1989 by a researcher named Tim Berners-Lee. In 1990, after 20 days, he introduced another programme and now millions of servers are operated using this language. It is the language your web browser can understand. The basics of HTML are fairly simple to learn, just by knowing the basic tags, you can design an entire website. A "tag" is a coded command used to indicate how the part of the webpage should be displayed.

PHP:

PHP- Originally derived from Personal Home Page Tools, now stands for Hypertext Preprocessor is an open source server side programming language extensively used for web scripts and to process data passed via the Common Gateway Interface from HTML forms etc. PHP can be written as scripts that run on the server and may produce HTML output that downloads to the web browser. Alternately, PHP can be embedded within HTML pages that are then saved with a 'php' extension. The PHP sections of the page are then passed by the PHP engine on the server and the PHP

code stripped out before the page is downloaded to the web browser.

The PHP allows web developers to create dynamic pages for e-commerce and other web applications that interact with databases. PHP applications are normally found on Linux servers and in conjunctions with MySQL databases. It provides those servers with functionality similar to that provided to the Windows platform by Active Server Pages technology.

MySQL:

MySQL is an open source Relational Database Management System (RDBMS) that uses Structured Query Language (SQL), the most popular language for adding, accessing and processing data in a database. MySQL is noted mainly for its speed, reliability, and flexibility. It is commonly employed with most of the popular server-side scripting language including PHP, JSP and ASP. It is a multithreaded, multi-user, SQL (Structured Query Language) relational database server (RDBMS). MySQL is available either under the GNU, GPU (General Public Licence) or under other licences when the GPL is inapplicable to the intended use. MySQL is a freely available third-party databases engine designed to provide fast access to stored data. Data can be stored, updated and deleted using languages such as PHP. The data can be retrieved from the database to allow the generation of Dynamic Webpages.

Project Life Cycle

We choose a linear Sequential model, the purpose of this model is that it work Parallels within modules. This model also called the Waterfall models that follow the following steps:

Website Requirement Analysis

- * Design
- * Coding
- * Testing

Website Requirement Analysis

Requirement Analysis is Understand after the scope of the system to be built. In our project we needed Flash, PHP-MYSQL.

- * Designing

Designing is the major part of any website designing. Proper design is the base of any project.

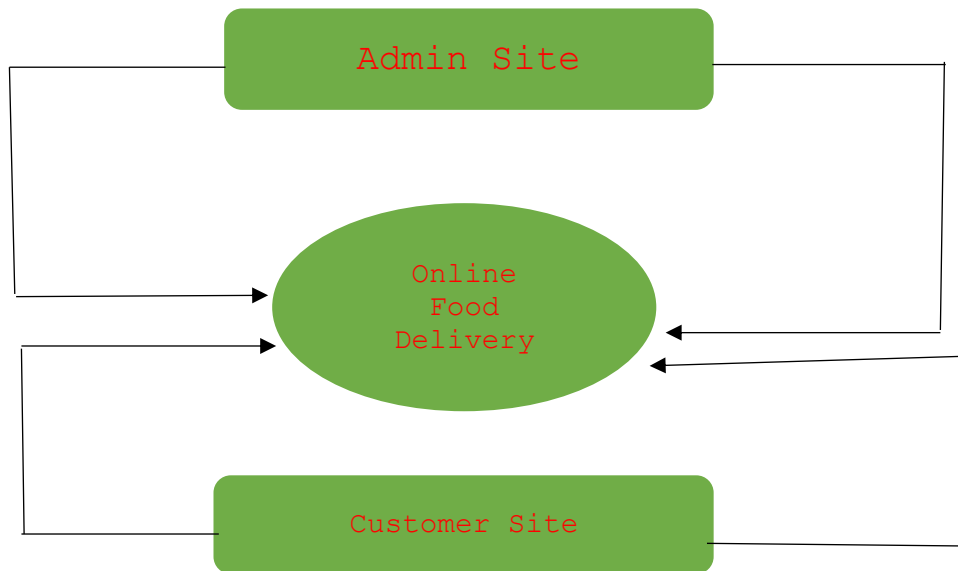

- * Coding

The coding for any phase is as needed as the design phase of the project. Coding was the second major task. Coding was done parallel as with the design of the project.

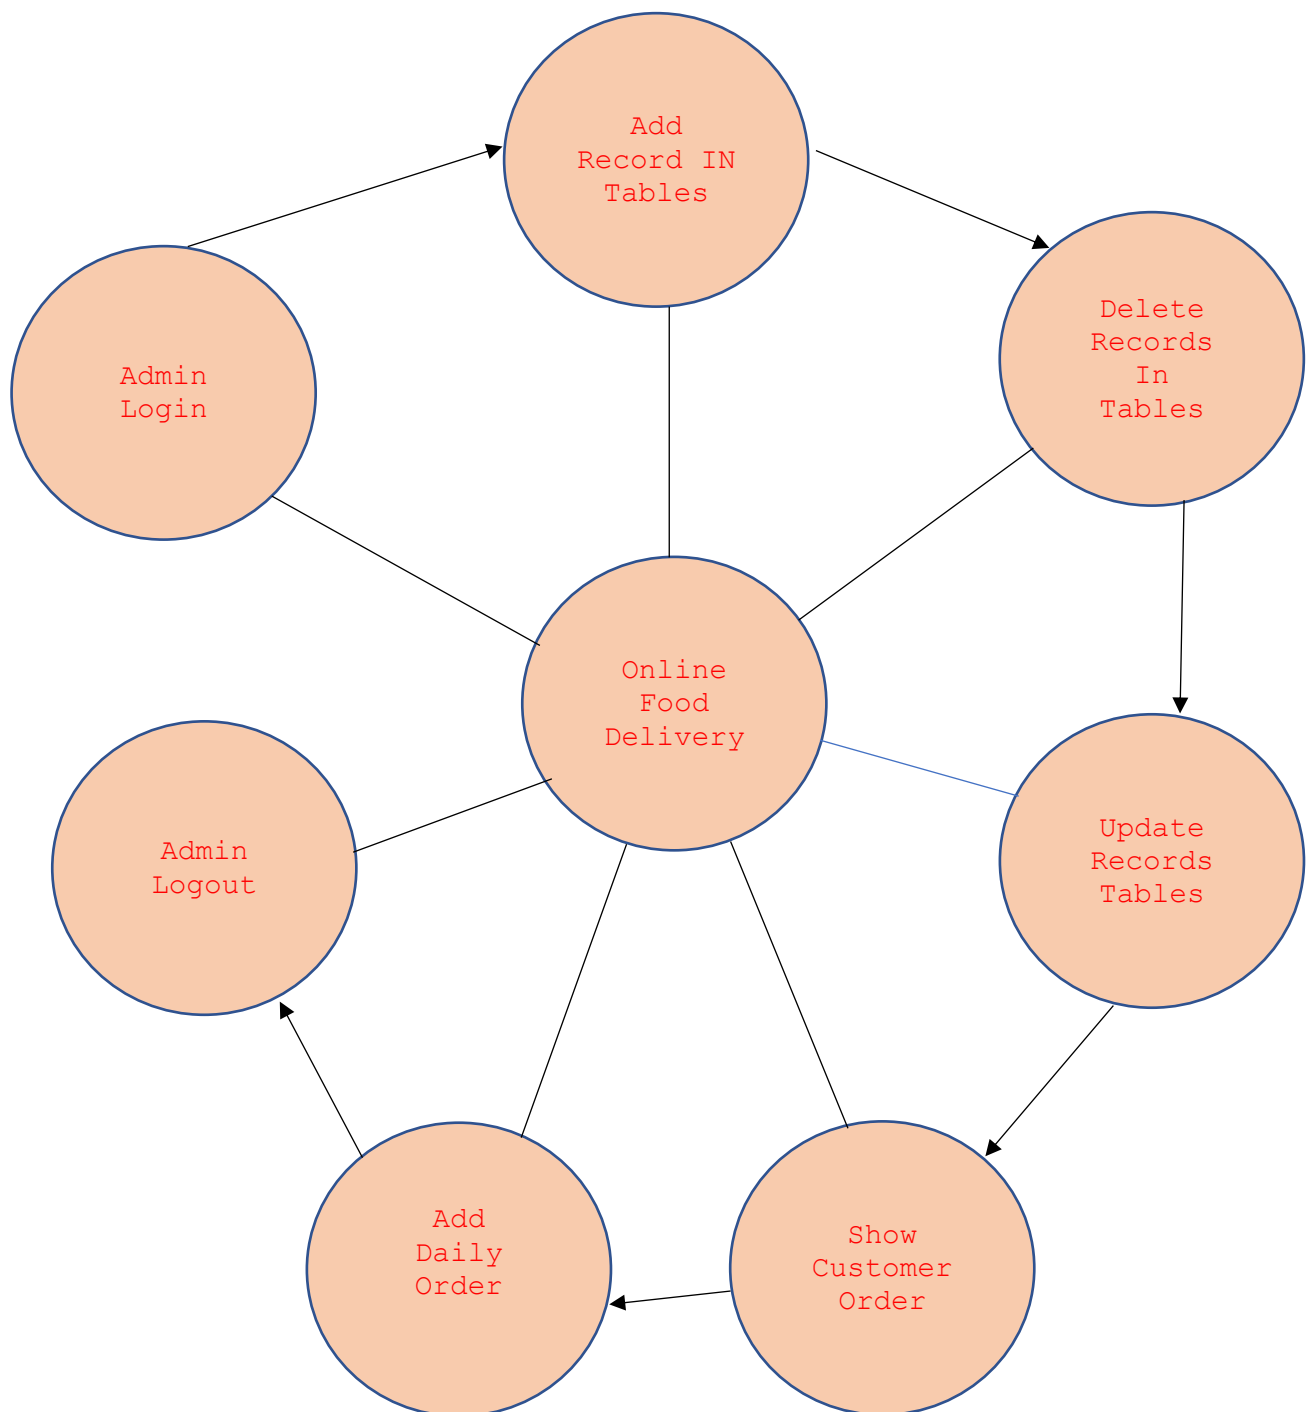

- * Testing

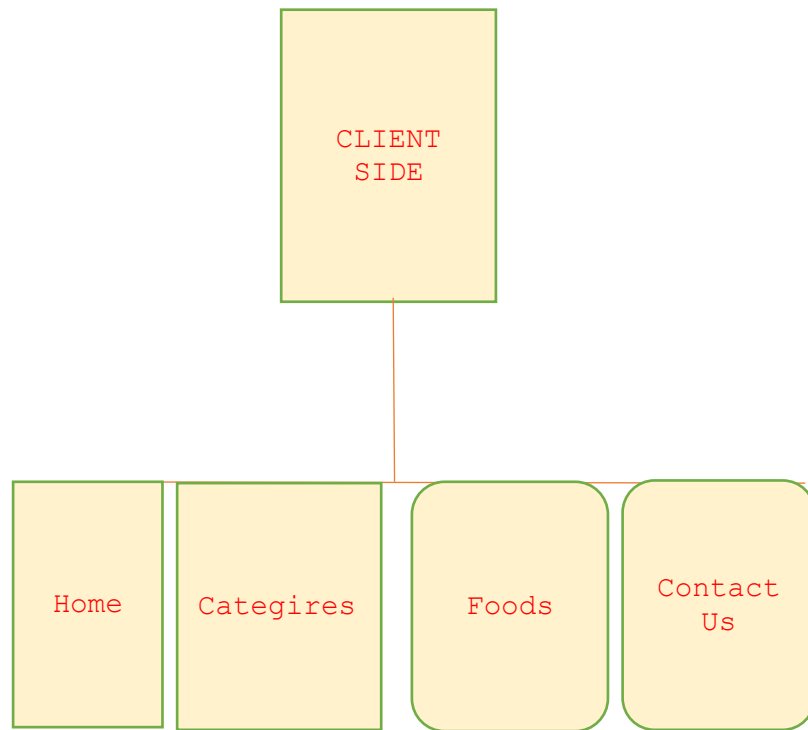

Testing was done on the regular base during the coding phase itself. Some error that remains uncovered that is done properly at the time of Testing. And we get the required output that we want. A large amount of situations create while entering the data during input processing. So, testing is done get the desired output

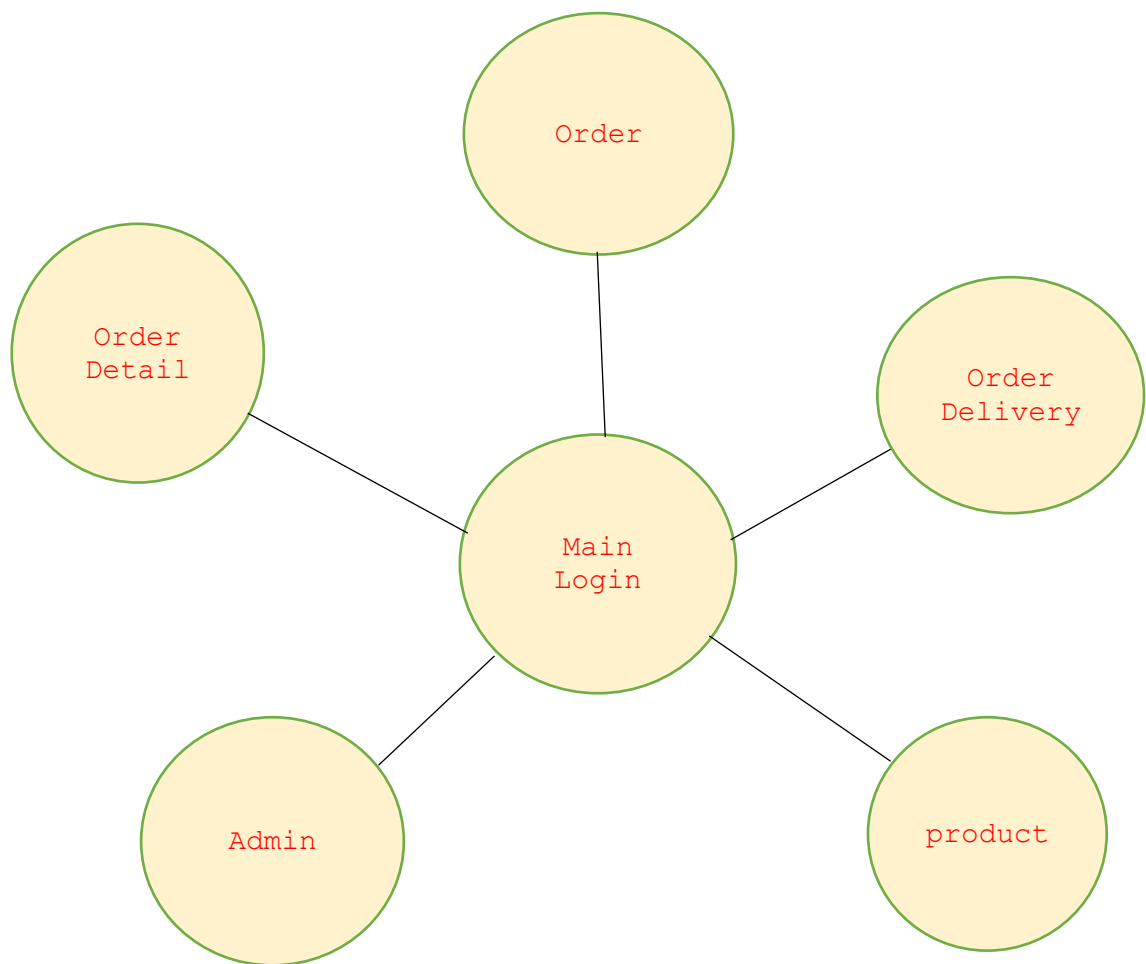

Program Structure

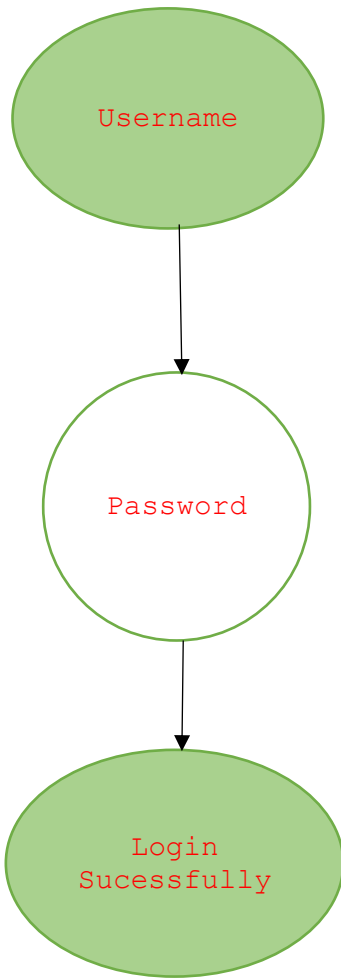

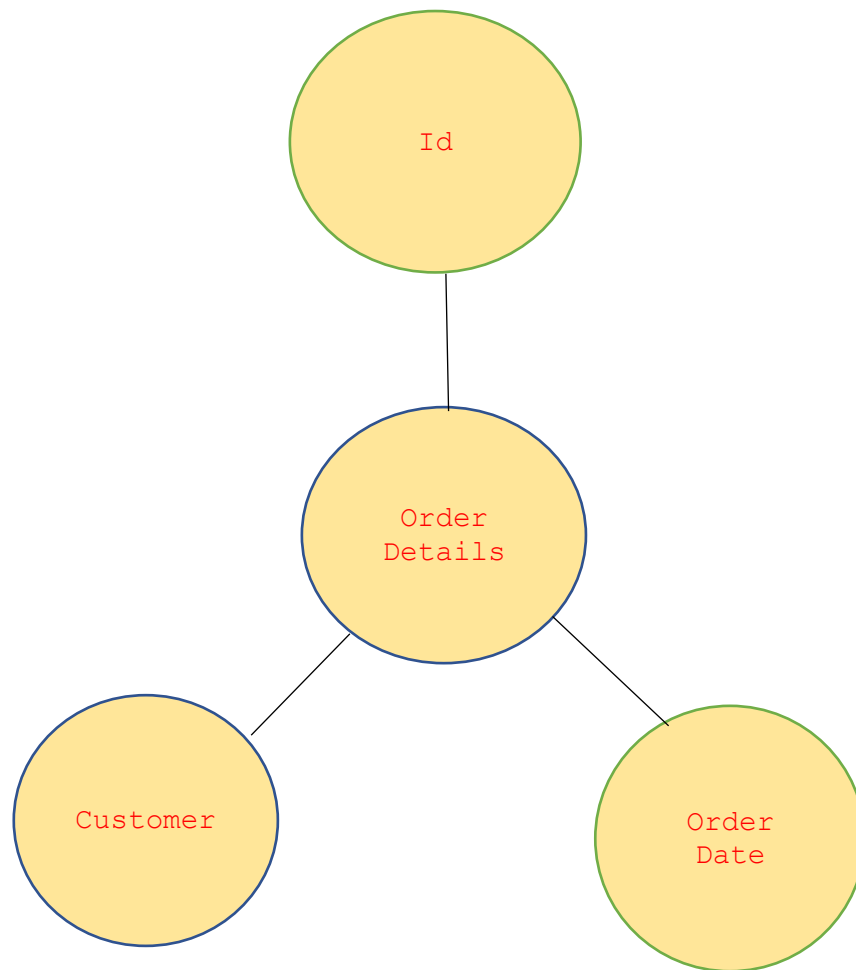

Data Flow Diagram

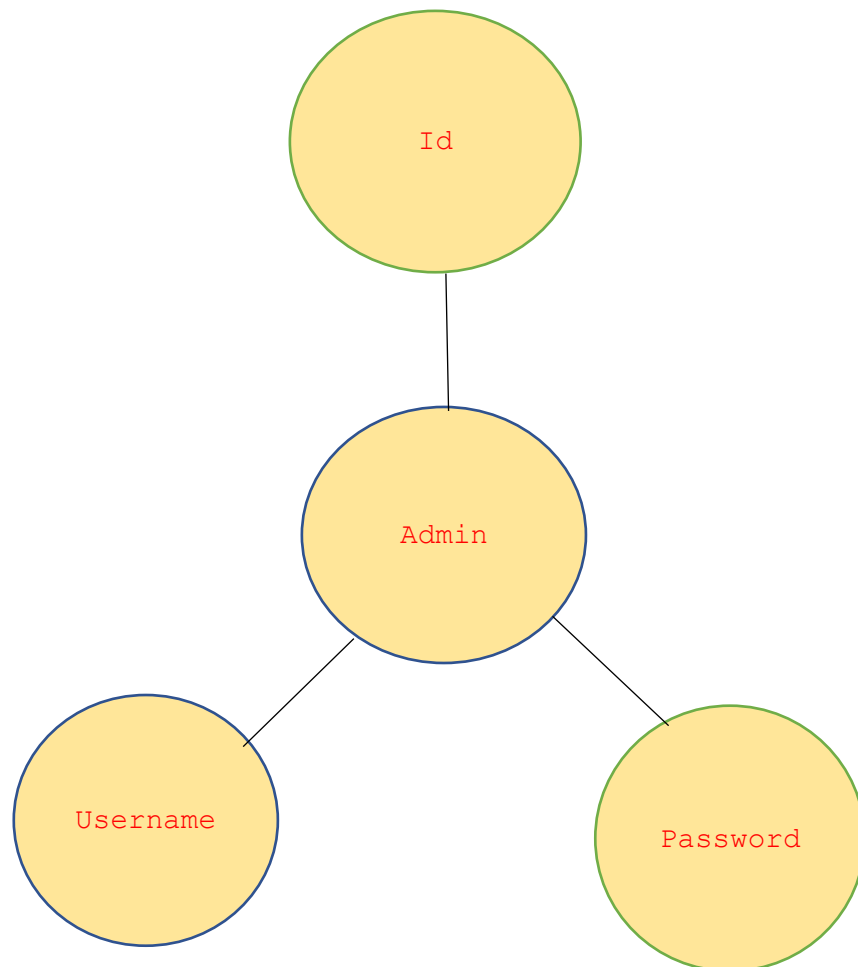

Data Dictionary

[1]

Table Name: tbi_admin

Field Name	Data Type	Description
id	int(10)	Id
full_name	varchar(100)	Name
username	varchar(100)	Username
password	varchar(255)	Password

[2]

Table Name: tbi_category

Field Name	Data Type	Description
id	int(10)	Id
title	Varchar(100)	Title
Image_name	Varchar(255)	Image Name
featured	Varchar(10)	Featured
active	Varchar(10)	Active

[3]

Table Name:tbl_food

Field Name	Data Type	Description
id	int(10)	Id
title	Varchar(100)	Title
description	text	Description
price	Decimal(10.0)	Price
Image_name	Varchar(255)	Image Name
Category_id	int(10)	Id
featured	Varchar(10)	Featured
active	Varchar(10)	Active

[4]

Table Name:tbl_order

Field Name	Data Type	Description
id	int(10)	Id
food	varchar(255)	Food
price	decimal(10.0)	Price
qty	int(11)	Qty
total	decimal(10.0)	Total
order_date	date	Date
status	varchar(50)	Status
customer_name	varchar(150)	Name
customer_contact	varchar(20)	Contact
customer_email	varchar(150)	Email
customer_address	varchar(255)	Address

LIMITATION

Most of software project have some limitation, it is not perfect in all way. Limitation of this software is described below :

- This website is not responsive.
- In this website online payment is not available.
- User cannot receive email about their form fill-up.
- User cannot see their details later.

These limitations can be solved by working on the project of more than the period allocated for the project.

FUTURE SCOPE

The future scope of this system is following :

- I can develop UI better then now.
- It can also possible to develop android app for this website.
- It can also possible to make website responsive.
- With SMTP can add functionality of email.
